Qadam Delivery

Local delivery for small businesses in Almaty through Telegram

Primary Market Research
& Opportunity Defense

Task 3 / Midterm defense / October 2026

Early courier interviews and registration. Market figures include assumptions.

Our first customer: a small shop in Almaty

A business-side hypothesis to test in a B2B pilot

Who makes the decision

A shop owner or administrator
who arranges delivery to the buyer.

Initial customer segment

Flower and gift shops, and small sellers
who take orders through social media.

6.7

hours of coordination per month

40 deliveries × 10 minutes ÷ 60

Assumption: time spent finding a courier, sharing addresses and checking order status.

Primary research: courier interviews

Completed interviews and registration. Follow-up questions appear on the right.

8–10

couriers interviewed (approx.)

Qualitative research focused on potential delivery partners.

Couriers registered on Qadam

An early step in building local supply

01 Describe your last completed delivery.

02 How did you find that order?

03 What were the payout and travel costs?

04 When did you last wait without orders?

05 Which orders have you declined, and why?

Early evidence from the courier side

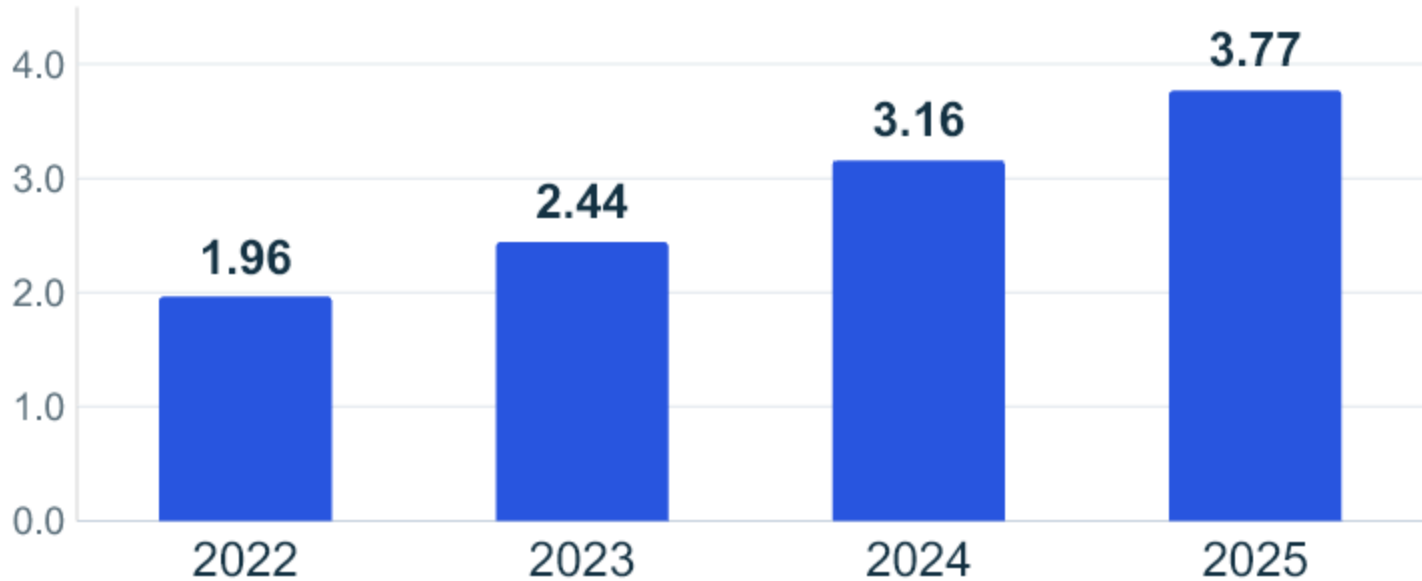

Research scope: courier interviews and registration on the platform

Evidence	What it shows	What remains unknown
About 8–10 courier interviews	Access to potential partners	Quantified pain and common themes
Couriers registered on Qadam	Accounts ready for pilot invitations	Regular availability and engagement
Order acceptance and delivery	Next stage of testing	Completion rate and repeat activity
Paying business customers	Future customer-side research	Willingness to pay and volume

Next evidence: availability, accepted orders and repeat activity

Kazakhstan’s e-commerce market is growing

Retail e-commerce turnover, KZT trillion, including marketplaces

24.3%

CAGR for 2022–2025

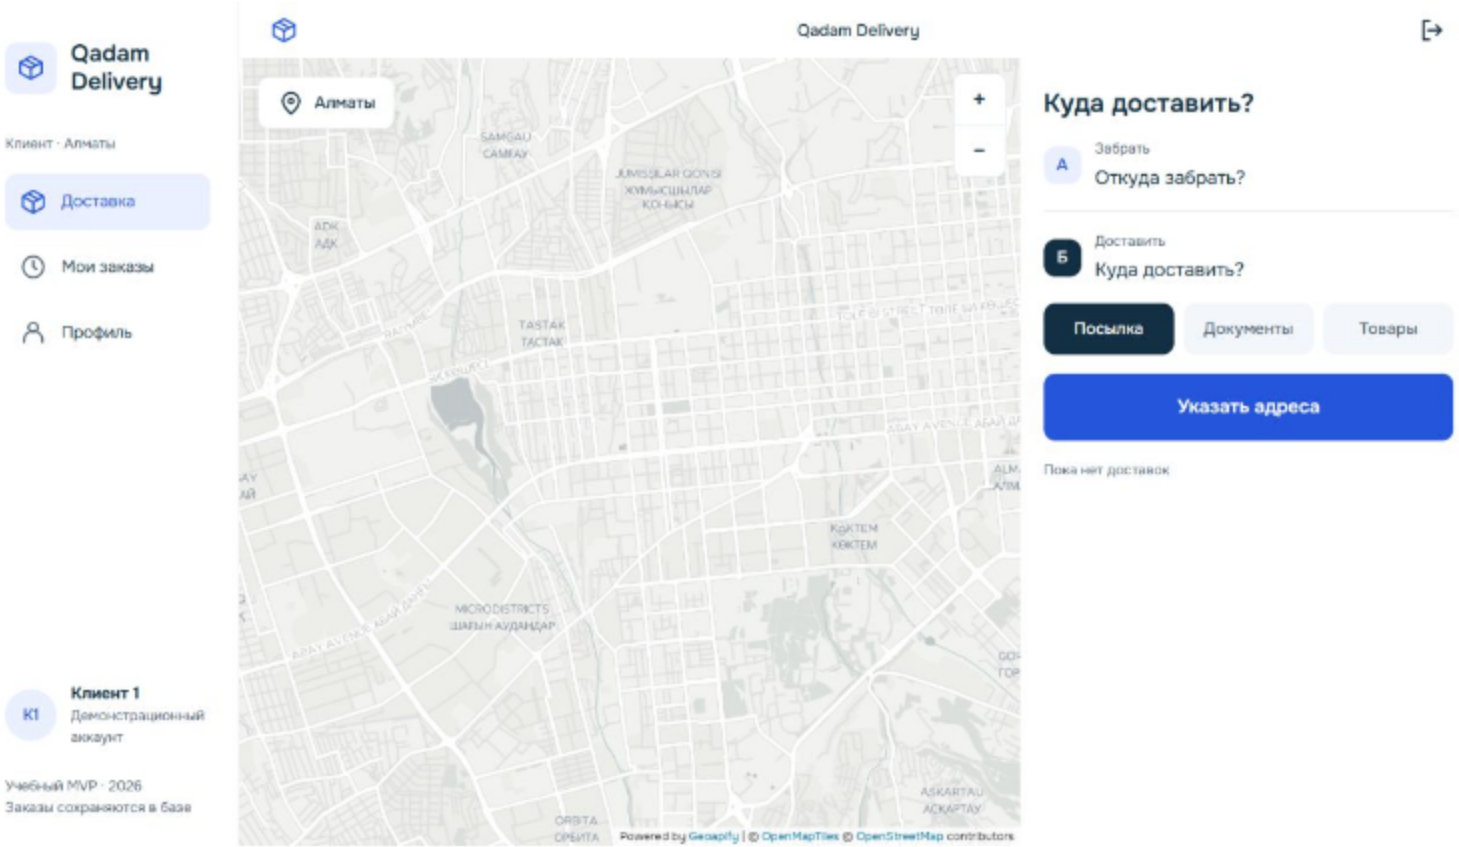

[(3.7688 / 1.9635)^(1/3) − 1] × 100%

Nominal growth in goods turnover. Courier-sector growth requires a separate estimate.

The current Qadam Delivery MVP

A Telegram Mini App and browser version for the delivery workflow

01 **Create a delivery order**

02 **Courier accepts**

03 **Update delivery status**

04 **Restore order history**

Russian-language demo.
Shared flow for B2B pilots.

GPS updates while the app is open and permission is granted.

Digital alternatives and market penetration

Business-side penetration remains unmeasured: interviews covered couriers only

14.3%

Online sales as a share of Kazakhstan’s retail turnover, 2025

This measures sales turnover. Courier registration is an early onboarding signal. Local penetration needs a defined market denominator.

Current alternative	Evidence to collect
Delivery service	Frequency, price and reasons for use
Regular courier	Availability and replacement options
Manual arrangements	Time spent and handover errors

Penetration = n / N × 100%

n = businesses using a digital delivery service
N = all surveyed businesses in the target segment

TAM / SAM / SOM: a working scenario

All customer counts, delivery volumes and platform fees below are assumptions

Market scope	Eligible businesses	Annual Qadam revenue
TAM: Kazakhstan	10,000	KZT 1.44bn
SAM: Almaty	1,500	KZT 216m
SOM: first 1–2 years	50	KZT 7.2m

50 businesses × 40 deliveries × KZT 300 × 12 = KZT 7.2m

KZT 300 is assumed platform revenue per order. Courier compensation is separate.
SOM is annual revenue at the target scale, before expenses.

Revenue sensitivity and the path to SOM

Scenarios with 50 active businesses. Illustrative calculations, not sales forecasts.

Scenario	Monthly deliveries per business	Revenue per order	Annual revenue
Conservative	25	KZT 200	KZT 3.0m
Base	40	KZT 300	KZT 7.2m
High	60	KZT 350	KZT 12.6m

2,000

deliveries per month in the base scenario

Acquisition plan: 5 pilot businesses, 20 active businesses by month 12, and 50 by month 24.

Registration alone does not establish availability, delivery capacity or repeat participation.

Next step: a pilot with real deliveries

Proposed four-week pilot: 5 businesses and registered couriers, aiming for 50 deliveries

Test	Proposed continuation criterion
Paying demand	3 of 5 businesses pay for the agreed pilot
Repeat use	3 of 5 businesses order again after week one
Value and reliability	30% less coordination time. ≥90% delivered on time
Order economics	Positive contribution after variable costs

Courier interviews and registration give us a starting point

The pilot will test paying demand, repeat use and delivery economics.
